Two-day live Q3 onboarding handbook

Updated 14 October 2026 for onboarding in the week of 12-18 October. Participants will use the live database to enter their real Q3 2026 funding and expenditure. Q3 covers **1 July to 30 September 2026 inclusive**. Every confirmed submission contributes to live reporting. Use actual source amounts, transaction dates and references throughout.

The two days combine training with supervised completion of each MDA's Q3 return. Day 1 covers access, source preparation, reference requests and supervised manual entry. Day 2 covers AOP additions, discussion, corrections, audit trails, a readiness-gated AI import lab, offline capture and reconciliation. Participants leave with verified entry IDs and, where import is cleared, batch receipts and a list of unresolved source-data issues. It is not a dummy-data exercise. Do not insert invented amounts, test references or October transaction dates for July-September activity.

How to use this handbook

Audience: MDA Users, Viewers (reviewers) and Admins. Suggested timing is **09:00-15:00 on each day**, including breaks; the facilitator may move the start time while preserving the practical work. Calendar dates are to be confirmed by the organizer. Pair each MDA submitter with a Viewer and keep an Admin available for access, reference and planning issues.

Each activity below names a result participants should demonstrate. Where no genuine transaction, correction, reference request or AOP addition is needed, inspect an existing record or complete the exercise on paper. Save only verified work that belongs in the live system. The supplied synthetic workbook is for the Day 2 import discussion or preview only; cancel its batch without inserting. If import remains unready, continue manual entry and assign file processing for follow-up.

Use the agendas first, then the numbered activities and field guides. The PDF also includes the offline runbook and a printable submission record. An unfinished return needs a named owner and follow-up date; attendance alone is not completion.

Day 1 - Access, preparation and live entry

Outcome: Each MDA knows its permissions, has checked the source register and existing records, and can save verified Q3 transactions with traceable entry IDs.

Time	Activity	Practical result
09:00-09:20	Welcome and live-data rules	Distinguish planned budgets, funding received, expenditure and summary returns. Agree the MDA's submission owner.
09:20-10:00	1. Access and account clinic	Verify named login, role and separate funding/expenditure grants. Demonstrate one allowed action and explain one restriction.
10:00-10:25	Source preparation	Record starting Q3 counts/totals; check references, date range and aggregate overlap. Split manual, import and offline work without duplication.
10:25-10:40	Break	Keep accounts secure and any pending records intact.
10:40-11:15	2. Request missing values or fields	Submit a genuine missing-value request or prepare one on paper. Admin demonstrates the decision path.
11:15-12:15	3. Guided manual entry	Enter verified outstanding Q3 receipts/payments. Check expenditure allocations, entry IDs and visibility after refresh.
12:15-13:00	Lunch	Check queue state before leaving the device.
13:00-14:20	Supervised real entry	Continue verified manual funding and expenditure entry. Check each saved ID, source allocation and Q3 register result. Prepare CSV/XLSX sources for Day 2 without uploading them.
14:20-15:00	4. Day 1 handover	Reconcile manual entries and source totals. Assign access, reference, AOP and file-preparation follow-ups for Day 2.

Day 2 - AOPs, review, AI import and completion

Outcome: Each MDA can link payments to the right AOP, respond to a Viewer, trace changes, inspect import suggestions safely, recover from connectivity loss and account for its intended Q3 return.

Time	Activity	Practical result
09:00-09:15	Reopen and recap	Recheck Q3 is open, reload Day 1 entries and review unresolved work.
09:15-10:00	5. AOP additions and linkage	MDA prepares an evidenced addition; Admin checks/adds it where required; submitter finds the matching activity for a genuine payment.
10:00-10:35	6. Comments and responses	Viewer asks a genuine question; MDA responds on the same entry; both refresh and verify persistence.
10:35-10:50	Break	Preserve pending work and source records.
10:50-11:25	7. Corrections and audit trails	Explain missing Edit actions, inspect an audit event and demonstrate an Admin reason or existing amendment without publishing Q3.
11:25-12:10	8. AI import lab, subject to readiness	Check readiness. If cleared, preview the synthetic workbook, cancel its batch and review verified real files; otherwise teach mapping and warnings from the workbook without uploading.
12:10-12:55	Lunch	Keep unattended devices locked.
12:55-13:25	9. Offline capture and recovery	Follow the offline runbook with one genuine outstanding transaction; verify exactly one server record after synchronization.
13:25-14:30	10. Reports and reconciliation clinic	Inspect report filters and compare source records, ledger totals and outstanding issues; complete manual entry as needed.
14:30-15:00	Competence checks and handover	Complete the role checklist and MDA submission record. Name follow-up owners; agree the separate publication process.

Facilitator preparation and checkpoints

Before Day 1, confirm the live URL: https://budget-tracker--budget-tracker-2fb26.us-east4.hosted.app/. Prepare separate browser profiles for the three facilitator roles, named participant accounts, source registers, the approved AOP/budget, and an offline copy of this handbook. Keep passwords and invitation links off the projector. Assign a facilitator to record blockers while the main trainer demonstrates.

Verify account access, Q3 publication state, reference lists, AOP availability and starting counts/totals. Keep FY2026 Q3 open through both days and any remaining authorized data-entry window. Do not publish it as a training exercise. The entry-date default may be today's Q4 date; teach every participant to check July-September dates before saving.

Reserve one actual outstanding transaction for the offline exercise and exclude it from any Day 2 file. Check the chosen browser and loaded form online before disconnecting. Keep the synthetic workbook, labelled DO NOT INSERT, separate from real source files.

Before the Day 2 lab, verify that the live import flow can upload, inspect, map, validate and cancel the synthetic batch without inserting. Confirm separately with the technical owner that insertion and receipt have passed an end-to-end check before anyone confirms a real file. If either check fails or remains incomplete, use the workbook outside the app to explain mapping and warnings and keep entering real records manually. Do not make participants depend on AI suggestions to complete their returns.

At the end of Day 1 and start of Day 2, compare the submission log with the register, inspect pending/failed offline items and revisit unresolved requests. Day 1 files remain unuploaded; if import is cleared on Day 2, prepare a working copy containing only genuinely outstanding rows.

What users can do today

Routine data entry uses two authenticated web forms: **Funding** for money received and **Expenditure** for money spent. Each submission records one transaction. Dropdowns use controlled reference data. The signed-in user supplies the audit identity; fiscal year and quarter come from the transaction date.

Valid entries become reportable when saved to the server. There is no approval or rejection queue. Comments ask for clarification without changing reportability. Publishing a quarterly Budget Implementation Report (BIR) locks new routine entries and edits for that quarter. Admin corrections after publication use an audited amendment.

Offline form submissions can be saved in this browser's local outbox and sent on reconnection. A pending local record is not yet a server submission or part of server reports.

Imports / Import entries is available for CSV and XLSX transaction ledgers, but the AI import workflow is not yet fully ready for this training. Day 1 uses the manual forms. On Day 2, the facilitator first checks the live draft flow with the synthetic workbook. The app can suggest workbook sheets, column mappings and meanings for unmatched values; users must verify each suggestion. Validation and insertion are separate confirmation steps. Use real-file insertion only after the technical owner clears insertion/receipt, the facilitator checks the live draft flow and the MDA owner reconciles its preview. If the readiness check is incomplete, defer live imports and continue manual entry. PDFs and planning/summary datasets (monthly returns, budgets, AOP, quarterly totals) are not accepted as transaction imports. The separate AI assistant remains read-only.

Prepare each MDA's real Q3 data

Bring July, August and September receipt/payment registers, actual release references and payment vouchers, the funding source for each payment, programme/category classifications, and supporting documents. Bring the 2026 approved budget and AOP for reference where applicable; those plans are not themselves cash transactions.

Before entry, the facilitator and MDA owner check existing Q3 records, source references and any historical aggregate entries. Record starting counts/totals by MDA and ledger. Assign one submission owner per source file/register, and mark which rows will be entered manually versus imported. The same transaction must not go through both paths.

Admin must verify that Q3 2026 is open for routine entry. If its BIR has already been published, use the established correction/amendment process rather than changing transaction dates or bypassing the lock. Q3 status and current live totals must be checked in the application; this handbook does not assume they are open or empty.

Check for Q3 aggregate rows from a prior report; they can overlap detailed transactions despite different references. Admin must reconcile any overlap before new detail is confirmed.

Roles and account preparation

Role	What to teach	What it cannot routinely do
MDA User	Enter or import funding/expenditure for specifically assigned MDAs and permitted ledgers; view assigned data; respond to comments; edit own entries before publication; request missing reference values.	Submit for unassigned MDAs, manage reference lists, publish a BIR, or edit a locked quarter.
Viewer	The app's label for a reviewer. View statewide entries and reports, inspect available warnings/audit history and add comments.	Approve/reject entries, edit transactions, manage users or reference lists, or publish a BIR.
Admin	Manage users, roles, MDA grants, reference requests, reference data, approved budgets and AOP activities; inspect reports; make reasoned corrections; publish and amend BIRs.	Use routine edits to bypass a published-quarter lock.

Funding and expenditure permissions are separate grants. Assigning an MDA alone is not a substitute for the appropriate `funding_submitter` and/or `expenditure_submitter` grant. Test both expected menu items before handing over an account.

Each attendee needs their login email/password or accepted invitation, assigned role, correct MDA grants, an internet connection for initial sign-in and setup, and source documents showing the actual transaction. Use a supported modern browser with local storage enabled.

Use each participant's named live account. Use separate browser profiles for the facilitator's MDA, Viewer and Admin accounts. The current offline outbox is browser-wide; do not switch accounts while submissions are pending. Seed/demo accounts and shared passwords are not the onboarding login procedure. Viewers inspect and comment on live submissions; they do not use Imports or approve transactions.

Funding field guide

Open **Funding / New funding entry** (`/funding/new`). Check the default date before saving: use the actual July-September receipt date, not the October onboarding date.

Field	Required	Meaning and rule
Transaction date	Yes	Actual date funds were received. Enter a valid calendar date.
MDA	Yes	Select an MDA for which you have funding submission permission. A single assignment may be preselected.
Programme Area	Yes	Select the active programme classification.
Funding Source	Yes	Select the source of the money received, such as a government release, BHCPF or donor funding.
Amount	Yes	Nigerian naira, greater than zero. Use at most two decimal places. Commas are accepted by the form.
Reference Number	Yes	Actual source reference. Must be unique for this MDA and fiscal year within the funding ledger.
Remarks	Conditional	Optional unless Programme Area or Funding Source is Other. Explain any Other selection.
Fiscal year and quarter	Automatic	Derived from the transaction date; do not enter the year of today's data-entry session.
Entry ID, author and timestamp	Automatic	Created by the system. Keep the public entry ID for follow-up.

Do not record an approved budget or a promised allocation as money received. Record receipts supported by the source, using the actual receipt date and reference.

Expenditure field guide

Open **Expenditure / New expenditure entry** (`/expenditure/new`). Use the actual July-September payment date and check that the derived period is FY2026 Q3.

Field	Required	Meaning and rule
Transaction date	Yes	Actual date the expenditure was paid.
MDA	Yes	Must have expenditure submission permission for the selected MDA.
Money Amount	Yes	Total spent in naira, greater than zero. Use at most two decimal places.
Voucher Reference Number	Yes	Actual payment/voucher reference, unique for this MDA and fiscal year within the expenditure ledger.
Funding source breakdown	Yes	At least one actual funding source and positive allocation. Each source appears once; all allocations must equal the expenditure amount. The legacy Unspecified source is not allowed for new manual entries.
Payment Method	Yes	Select the method actually used: the configured bank transfer, cheque, cash, GIFMIS, IPPIS or Other option.
Programme Area	Yes	Select the relevant programme classification.
Expenditure Category	Yes	Select the spending category. A selected state-budget item can set and lock this classification.
Approved Budget Item	Optional linkage	Appears when a funding allocation uses the state-budget source. Select a matching MDA/year/class line where applicable. The current validator does not make this universally mandatory.
Expenditure Item	Optional	For non-state-budget classification, choose a configured item consistent with the selected category.
AOP Activity	Optional	If linked, must belong to the same MDA and fiscal year.
Remarks	Conditional	Required when Programme Area, Expenditure Category or Payment Method is Other.
Voucher attachment	Not ready for training	The UI accepts one image/PDF up to 10 MiB, but the route currently ignores the file argument. Do not promise that choosing a file saves it.
Fiscal year, quarter, entry ID, author and timestamp	Automatic	Derived or recorded by the system.

Use the actual source allocation documented for the payment. All allocated amounts must equal the expenditure total. Splitting funding does not create two expenditure transactions. A single-source allocation follows the total amount automatically in the form. Payments funded from several sources should use this manual form; the current importer supports one funding source per expenditure row.

Activity 1 - Understand and verify access

Who: Everyone, with Admin support. **Evidence:** Each participant records their role, allowed MDA(s), funding access and expenditure access on the submission record.

1. Sign in to your named account online. Identify the displayed role and available menus. Open Entry Register and check the MDA scope against your assignment.

2. An MDA User opens the permitted Funding and/or Expenditure form. Compare the available MDA choices with the assignment. Being able to view an MDA does not itself grant the right to submit both ledgers.

3. In the separate Viewer profile, open the register and reports. Explain statewide oversight and comments. In the standard Viewer setup there is no transaction entry/import or user-management workflow.

4. Admin opens **Users**, locates the participant and chooses **Manage**. Inspect the role and funding-entry/expenditure-entry MDA grants. Correct only actual approved access problems, then **Save access**. Participant reloads online or signs in again after first resolving any local queue.

5. Where a new participant needs an account, Admin demonstrates **Create a user** with full name, email, role and the appropriate grants. Choose email invitation or a temporary password delivered privately. Check the success/delivery result; a created account does not prove the invitation arrived. Manage also offers invitation resend and password reset for genuine access support.

6. Ask participants to explain why an unassigned MDA is unavailable and why knowing an entry link does not grant access. Do not change role or grants merely to create a classroom example.

Access request to the Admin: Provide your named email, requested role, MDA name, funding and/or expenditure duties, and the authorizing officer. Access requests use the organization's support channel; **Request a value** is for dropdown data, not user permissions. Do not include passwords in a request or entry comment.

Check: An MDA User identifies their scope, a Viewer finds an entry without editing it, and an Admin explains how role and ledger grants work together. Resolve missing access before assigning live entry work.

Activity 2 - Request missing values and new fields

Who: MDA Users and Viewers prepare the need; Admin resolves reference requests. **Evidence:** A real request's label/type, status and follow-up owner, or a completed paper example when no change is needed.

First identify the kind of change:

Need	Correct route	Example and result
Another value in an existing dropdown	**Request a value**; Admin **Reference requests**	A verified funding source or expenditure item becomes selectable after Admin resolution.
Another AOP activity	Give the approved source row to Admin; **AOP activities**	An activity is added for the correct MDA/year, then linked to expenditure. Follow Activity 5.
An entirely new form field or report requirement	Record a development request through the agreed support channel	A new data column requires design, validation and implementation. Reference requests do not change the form schema.

1. Search the existing dropdown first, including known names and abbreviations. Do not create a second label for the same underlying value.

2. Open **Request a value** (`/reference-requests`). Select **What needs adding?** and enter the exact **Value**. Supported kinds include MDA type, MDA, programme area, funding source, expenditure category/item, payment method, LGA and facility.

3. For an expenditure item, choose its parent **Expenditure category**; for a facility, choose its **LGA**. Add **Related MDA** where relevant and explain **Why is it needed?**, citing the source and intended use. AOP activities are not a reference-request kind.

4. Submit only a genuine request. Check it under your requests and note **Pending**. While it is unresolved, preserve the affected source row. Do not pick an unrelated value to force a save. Use Other only if it accurately describes the transaction, with the required remarks.

5. Admin opens **Reference requests** (`/admin/reference-requests`), checks duplicates and source evidence, then either approves using an existing value or creates the verified new value. A rejection requires a short explanation. Request approval applies to the dropdown request, not to financial transactions.

6. Requester reloads the request list, reads its status/comment and reloads the relevant entry form online. Confirm the resolved value is selectable and correctly classified. For an approved request linked to an existing value, use that canonical value. Do not assume an email notification or automatic update of an already open form.

New-field request exercise: Write the proposed field name, business purpose, data type/options, an example, who fills it, whether it is required and when, affected forms/imports/reports, treatment of old records, and source/owner. Give it to the facilitator for product/development triage. This is a proposed requirement, not an immediately available feature.

Check: Participants can distinguish a reference value, an AOP row and a new application field, and can explain how they will know their request is resolved.

Activity 3 - Save and verify a real transaction

Who: Authorized MDA submitter; Viewer checks the result. **Evidence:** One public entry ID per genuine record entered, reconciled to its source.

Use the Funding and Expenditure field guides above. Both forms require an amount greater than zero; an absent return is not a zero-value transaction. Choose a previously unrecorded Q3 source transaction and confirm no one else owns its submission. For expenditure, show how the funding allocations sum exactly to the payment and how an applicable AOP/budget linkage is selected. Demonstrate required-field guidance before completing the actual record; do not change valid source facts to provoke errors.

Save once, read the result, open the saved record and refresh online. Verify date, FY2026 Q3, MDA, amount, reference, classifications and allocations against the source. Viewer finds the same public ID in a separate profile. A success message alone is not the reconciliation. If a save times out, search its reference before retrying.

Check: Participants distinguish the source voucher/reference from the system public entry ID, and can find the saved record again. Existing records may be reviewed when there is no outstanding transaction to enter.

Admin planning data

Approved Budget forms require fiscal year, MDA, personnel, other recurrent and capital amounts. Amounts can be zero but cannot be negative. Recurrent and overall totals are calculated. The MDA/year combination is unique; an optional source label provides context.

AOP Activity forms require fiscal year, owning MDA, activity code, description and a non-negative budgeted cost. An optional source row number preserves legitimate repeated activity codes. Approved budgets and AOP costs describe plans; neither is evidence that cash was received or spent.

Reference data includes MDAs and their types, programme areas, funding sources, expenditure categories/items, payment methods, LGAs and facilities. During onboarding, create or update only genuinely required, verified reference values. Deactivate obsolete values to preserve history. Explain BIR publication using the screen and existing records; publish only when the real Q3 reporting process is complete and authorized.

Activity 4 - Close Day 1 and prepare Day 2

Each MDA compares its Day 1 manual entry IDs with the source register. Record starting and ending counts/totals by ledger and mark outstanding rows. Keep the unchanged original CSV/XLSX and prepare a clearly named Q3 working copy for the Day 2 readiness-gated import lab; do not upload it on Day 1.

List unresolved access, reference, AOP and source issues with owners. Reserve genuine Viewer discussion or correction work for Day 2. Check the offline queue before leaving; preserve failures and keep the same account and browser while work is pending.

Day 2 restart

Open several Day 1 entries by exact reference, confirm they persisted, review the issue log and check current publication state. Other users may have submitted records overnight, so refresh the baseline and duplicate checks before continuing.

Activity 5 - Add to the AOP and link expenditure

Who: MDA planning/data officer supplies verified source details; Admin maintains AOP records; authorized submitter links expenditure. **Evidence:** Correct MDA/year/activity in the AOP list and, where applicable, on a genuine payment.

1. MDA officer locates the approved Annual Operational Plan source row. Prepare fiscal year, owning MDA, activity code, description, budgeted cost in naira, and source workbook/version/page or row. Confirm whether this is a missing approved row or a proposed plan revision. Obtain the normal planning authorization before asking for a revision to be recorded.

2. Admin opens **AOP activities** (`/admin/aop-activities`) and filters by fiscal year and MDA. Search existing activities, including inactive records where relevant. MDA Users cannot directly open this Admin management page; send the addition to the Admin through the agreed support process.

3. If genuinely missing, choose **Add AOP activity** and fill **Fiscal year**, **MDA**, **Activity code**, **Description** and **Budgeted cost**. Cost can be zero but not negative. **Source row number** is optional and distinguishes legitimate repeated codes from different source rows; do not use it to disguise an accidental duplicate.

4. Compare the draft with the approved source, then **Add activity**. For an actual correction to an existing plan row, use its **Edit** action and verify the source before **Save changes**. Inspect existing data or cancel the form if there is no real addition/correction to make.

5. Refresh the AOP list and confirm the result under the intended MDA and year. In the submitter's online Expenditure form, set the genuine transaction date and MDA, then find the matching **AOP Activity**. If missing, check MDA, fiscal year and active status before requesting another copy.

6. Select the activity for a relevant genuine payment, check all transaction fields, save and verify its details. If linking an existing payment, the ordinary edit/publication rules still apply. Adding an AOP row does not automatically link earlier expenditure or record funds received/spent.

Check: Participants explain that AOP cost is planned cost, expenditure is actual payment, and an approved budget is a separate planning record. Admin demonstrates the approved-budget MDA/year view where available; compare like-for-like periods and scopes instead of treating every plan total as cash available.

Activity 6 - Discuss entries and verify comments

Who: Viewer and MDA submitter, in separate browser profiles. **Evidence:** A genuine question and response visible on the same entry after both profiles refresh, or a walkthrough of an existing discussion.

1. Viewer opens **Entry Register**, selects the correct Funding or Expenditure record and opens **Details**. Check public ID, reference, MDA, quarter and amount before writing.

2. Under **Comments**, enter a specific source-based question in **Add a comment or request clarification...**, then **Post comment**. For example, ask for confirmation of the actual date or allocation only when there is a genuine uncertainty. Avoid personal banking details or unrelated sensitive information.

3. MDA user opens the same entry and reads the question. Respond using the same comment box, identifying the question being answered. The current discussion is a flat list: there is no dedicated threaded Reply button, @mention workflow or demonstrated notification guarantee.

4. Both participants refresh online and check that the question and response remain, with the expected author, role and timestamp. Reopen the record from the register to confirm the discussion belongs to that record.

5. If a correction is needed, use Activity 7. A response or comment does not change the amount, the original **Remarks**, approval status or reportability. Remarks are part of transaction data; comments are the discussion alongside it.

Users discuss records they are permitted to access. An MDA user does not gain access to another MDA's entry merely because someone comments on it. Comments may continue after publication; they do not reopen the quarter. Do not promise comment edit/delete controls that are not present.

Check: The participant distinguishes a response from a financial correction and knows to reopen the entry to check for answers. Posting and refresh persistence were tested on live funding entry FL-2026-0001 on 14 October for both Viewer and MDA accounts. Two clearly marked training-test comments remain there; use them for a read-only demonstration if no genuine discussion is needed. This result does not establish that every ledger/role combination was tested.

Activity 7 - Explain edit rights and audit trails

Who: Everyone inspects records; Admin handles reasoned corrections/amendments. **Evidence:** Each participant identifies an event's action, actor and time, and explains why a selected record can or cannot be edited.

1. Open a permitted entry's **Details** and inspect its author, transaction date, fiscal year/quarter and **Open quarter** or **Published** status. A transaction date is not the same as the date the user entered or changed the record.

2. Explain the Edit rule: before publication, an MDA submitter needs the relevant ledger grant and must be the original author. A colleague's row or a historical imported/aggregate row can have Details without Edit even within the same MDA. Admin can make open-quarter corrections with an audit reason. Viewer reviews/comments but does not routinely edit.

3. Inspect **Audit events**. The detail view lists event type, actor (or System), timestamp and a reason where recorded. Ask: what happened, who did it, when and why? An empty list means no events are available in this view; do not infer that no change ever occurred. The current panel is not a field-by-field before/after comparison.

4. If a genuine open-quarter error exists, the authorized owner or Admin opens the edit form, checks the source and saves the actual correction. Admin must enter an audit reason. A useful reason identifies the corrected field and source, such as a voucher/register reference; avoid generic reasons like "training". Do not manufacture an incorrect amount to demonstrate a repair.

5. Refresh the entry, confirm corrected values against the source and inspect the resulting audit information. Reconcile any amount change and let the Viewer verify the answer. If no correction is needed, inspect an existing event or cancel the edit form without saving.

6. Admin and Viewer open the **BIR** report for the intended fiscal year/quarter. Explain publication using its current state or an existing published quarter. Publication locks routine additions and edits for that FY/quarter across MDAs; comments do not unlock it. Keep Q3 open for the working session.

7. On an existing published record where available, Admin points out **Amend published entry** and **BIR amendment history**. An authorized amendment needs a reason and creates a new publication version. Do not execute one solely for demonstration, and do not promise a normal Unpublish button.

Check: Each participant can distinguish financial review, reference-request approval and BIR publication. Valid saved entries report immediately; a Viewer does not approve them. If a form still says "pending until a viewer acts", explain that this is stale wording. A genuinely pending offline record remains local until it synchronizes.

Day 2 import procedure, after the readiness check

Use this procedure only if the facilitator has cleared the live draft-to-cancel workflow on Day 2, the technical owner has cleared insertion/receipt, and the MDA owner has verified the source. The importer accepts **UTF-8 CSV and XLSX, up to 10 MB and 5,000 data rows in the selected table**. Each batch imports one sheet/table of individual funding or expenditure transactions. A workbook may contain several sheets, but the user chooses one for the batch. Keep an unchanged original and prepare a working copy containing only the intended Q3 transaction data.

1. Open **Imports**, choose whether rows record Funding or Expenditure, select the file and press **Upload and inspect**. Uploading creates a private draft; it does not insert ledger records.

2. For a workbook, review **Workbook sheets** and select **Use this sheet** for the actual transaction table. Do not choose a dashboard, lookup, budget, monthly return or quarterly summary.

3. In **Map columns**, verify every suggested mapping against the sample values. If the file has no MDA column, select one permitted MDA only when every row belongs to it. Choose day-first or month-first interpretation for numeric dates based on the source. ISO dates such as 2026-07-15 avoid this ambiguity. Press **Apply and check rows** after changes.

4. Inspect **Ready**, **Blocked**, **Skipped**, **Excluded** and **All**. Correct genuine source errors using the row edit control and **Save and re-check**, or exclude unresolved/out-of-scope rows. A missing whole column must be added to the working file and mapped; do not invent values. Corrections in the preview preserve the uploaded original.

5. Check **Ready rows by quarter**: every included row for this exercise must be **2026 Q3**. The importer can accept other open quarters; it does not automatically restrict this session to Q3. Exclude accidental Q1/Q2/Q4 rows and verify Ready rows by MDA.

6. Reconcile the ready count and amount with the source records selected for insertion. Review hidden-row/formula warnings against the original. Acknowledge warnings only when the values are verified.

7. The submitter presses **Insert [count] funding/expenditure entries totalling [amount]** only when the displayed set is correct. Confirmation inserts ready rows into the live database and makes them reportable immediately. Blocked/skipped/excluded rows are not inserted. Their presence does not necessarily prevent confirmation of ready rows, so explicitly record any partial submission.

8. Read the receipt's committed count, amount and public entry IDs. Download **Issue report** and assign an owner to each unresolved row. Find the saved entries in the register and let the Viewer inspect them. A completed batch is immutable; remaining unresolved rows need a corrected follow-up file containing only outstanding transactions.

Funding imports require date, MDA (or a confirmed whole-file MDA), programme area, amount, funding source and reference number. Expenditure imports additionally require expenditure category, payment method and voucher reference, with one actual funding source covering the entire amount. Optional mappings include remarks, expenditure item and AOP code. The import mapping does not currently offer Approved Budget Item linkage; use the manual workflow when that linkage or split funding is needed.

An existing reference with the same date and amount can be skipped as already recorded. Compare its other details in the register as well; skip detection is not a full-field reconciliation. A reference with conflicting date/amount is blocked and never silently overwrites the entry. Use the normal correction workflow rather than assigning a new reference to the same transaction.

Repair damaged, oversized or unsupported files and upload a valid copy. Convert verified thousands/millions to naira; recalculate and save formulas without cached results. The importer never invents missing source facts or automatically repairs every corrupted file.

Source files outside the transaction importer

PDFs and the earlier multi-MDA budget tracking workbooks may contain aggregate returns rather than individual transactions. Use them as evidence for reconciliation or route them to the Admin's appropriate data-loading process. Do not reshape a quarter total into an invented voucher just to use Imports.

Activity 8 - Practise import processing and AI suggestions

Who: MDA submitters with the relevant ledger grant; Viewers observe. **Evidence:** A reviewed synthetic workbook and, only if the readiness check passes, a cancelled practice draft. Live receipts are recorded only for separately verified real files.

The supplied file is **SYNTHETIC_Q3_Import_AI_Practice_DO_NOT_INSERT.xlsx**, in `output/training-dry-run/`. Read its **Read first** sheet. It includes a transaction table plus summary and budget sheets to practise selecting the correct dataset. It is designed around the facilitator's Ministry of Health (HQ) MDA account; other MDAs should watch that profile or use their own real source file with the correct scope.

1. After the facilitator confirms the live draft flow works, upload the practice workbook to a Funding import draft. If not cleared, inspect the workbook in a spreadsheet viewer and discuss the same decisions without an app upload. If available, choose **Analyze sheets with AI**. Explain why **Funding Q3 practice** is the transaction sheet and why **Monthly summary** and **Budget plan** are not funding receipts.

2. Choose the transaction sheet. Optionally use **Suggest mapping with AI**, then compare each suggested field with its sample values. Map the nonstandard headers deliberately; AI suggestions require confirmation.

3. Run row checks. Locate the unfamiliar source, ambiguous MDA/source labels, missing reference, missing date/amount, negative amount, impossible September date, duplicate row and Other-without-remarks case. Use **Suggest answers with AI** where available, checking each suggestion against reference data and the source.

4. Locate the October row. It can be a valid Q4 transaction even though it is outside this Q3 exercise. An absence of validation errors is not proof that the row belongs in the intended return.

5. Explain which rows would be ready, blocked, skipped or excluded and how the preview total changes. Never resolve missing source facts by guessing. Review-only practice may use the workbook's supplied explanations; it is not evidence for real financial records.

6. **Cancel batch. Do not press Insert for this workbook.** Synthetic preview rows must never enter the live ledger. If the full workflow has been verified and the owner has reconciled a separate real file, follow **Day 2 import procedure, after the readiness check**. Otherwise record import as deferred and continue supervised manual entry.

Check: Each submitter explains how they checked an AI suggestion, one genuine validation issue and one scope issue. If AI or the draft flow is unavailable, explain sheet selection, mapping and reference resolution from the workbook and defer live import; do not promise an unverified demonstration. A PDF must be prepared through an appropriate source-to-transaction process outside this importer, with amounts/references verified against the original.

Activity 9 - Demonstrate offline capture and recovery

Use the offline runbook included after this guide. Allow time for the eight-minute demonstration, questions and server reconciliation. Keep the already loaded MDA session open; select only the genuine outstanding source transaction reserved on Day 1. If it was entered in the meantime, choose another verified outstanding record or demonstrate connectivity states without submitting.

After reconnection, search the reference online and verify exactly one correct server record and its public ID. Then let the Viewer find it. Imports, AI suggestions, comments, reference requests, AOP/user administration and Admin corrections are not included in the manual-entry offline queue.

Check: Participants can distinguish unsaved form text, a locally queued submission and a verified server save. They know to preserve a failed item, inspect the server and escalate the actual error instead of clearing storage or changing references to force another insert.

Activity 10 - Read reports and reconcile the return

Who: MDA owner, Viewer and Admin together. **Evidence:** Completed MDA submission record, explained differences and an owned issue list.

1. The MDA owner opens its entries and identifies FY2026 Q3, MDA and ledger. Viewer/Admin opens the relevant Reports screen and checks all displayed filters, reporting period and any "as of" date before interpreting totals.

2. Compare the intended source register with matching saved records. Identify starting entries, new manual saves, committed imports, synchronized offline entries and genuine corrections. Do not add local pending amounts or a draft preview to server totals.

3. Reconcile July, August and September, then the quarter, separately for funding and expenditure. Compare counts and amounts as well as references. A cumulative budget-performance figure or a planning total may cover a different basis from Q3 transactions; state the basis before explaining a difference.

4. Review remaining blocked/skipped/excluded import rows and any aggregate/detail overlap. Confirm which excluded rows are outside Q3 and which are genuine outstanding work. Missing data is not evidence of zero activity; do not create a zero-value transaction.

5. Use any available report export only after checking its filters and output. Verify that it downloads, opens and shows the intended period/totals before distribution. The browser dry run did not confirm PDF download completion, so the trainer should check that separately.

6. For the read-only **Assistant**, optionally ask a scoped question about recorded FY2026 Q3 data and verify the answer against the relevant report/register. It does not submit entries, approve records or resolve missing source documents. An answer is not a substitute for reconciliation.

Check: The team can trace a reported figure back to records and source evidence, explain outstanding differences, and agree who closes each issue. Final BIR publication follows the real reporting authorization after reconciliation and outstanding queues are addressed.

Completion and reconciliation for each MDA

Record MDA, submitter, source filename/register and version, starting Q3 counts/totals, new manual entry IDs, import batch receipts, and final Q3 counts/totals separately for Funding and Expenditure. Identify existing source records rather than assuming every upload row is new.

Account for every intended Q3 transaction as: already recorded and checked; newly saved manually; inserted by a confirmed import; or outstanding with a stated issue and owner. Rows excluded for belonging to another period/MDA should be listed separately. Reconcile by July, August and September as well as the quarter where source detail allows. Explain differences instead of adjusting figures to force agreement.

Download issue reports before closing completed batches. Assign missing references, ambiguous sources, unmatched classifications, possible aggregate overlaps and locked-period issues to a named person with a follow-up date. A partially imported file is not a completed MDA return.

Viewers check dates, references, classifications, allocations and source totals and leave genuine comments. This is a reconciliation check, not a software approval step. Admins handle access/reference issues and audited corrections. Retain supporting documents in the MDA's normal records process; a chosen voucher file is not proof of saved attachment.

Before leaving, confirm no pending offline entries remain unnoticed. Retain failed entries and error details for resolution; do not clear browser storage. Keep verified live submissions in the database. There is no post-training wipe or demo-data cleanup for these real Q3 records.

Day 2 reconciliation worksheet

Complete this with the MDA source owner and Viewer. Write a reason for every difference; a blank source row is not an explicit zero return. Attach the working register or issue list when the small cells are insufficient.

Check	Funding	Expenditure
July source count / NGN amount	_____	_____
August source count / NGN amount	_____	_____
September source count / NGN amount	_____	_____
Q3 source count / NGN amount	_____	_____
Q3 saved count / NGN amount	_____	_____
Already recorded / newly entered	_____	_____
Outstanding count / NGN amount	_____	_____
Difference reason / owner / due date	_____	_____

Competence check and MDA handover record

Ask participants to demonstrate their own role's tasks rather than only confirm that they understood the presentation. Mark each as **Demonstrated**, **Observed only**, or **Needs follow-up**.

Role	Tasks to demonstrate	Completion evidence
MDA User	Explain grants; identify correct Q3 dates; save/find a real record; reconcile an import preview; request a missing value; respond to a comment; find the right AOP; explain pending offline work.	Entry IDs/receipts, verified source totals, resolved or owned issues. Use observed-only where there was no genuine write to make.
Viewer	Find the intended MDA/period; compare sources and records; ask a useful question; verify a response after refresh; inspect an audit event; explain report filters and immediate reportability.	Recorded source checks, discussion and explained differences. No transaction approval required.
Admin	Inspect/correct approved grants; distinguish existing/new reference values; add a verified AOP row or explain the form; explain correction reasons, publication locks and amendments.	Correct participant access and an owned resolution list. Publication is explained without closing the training quarter.

For each MDA, complete this record on paper or in the agreed working register. This is a training/reconciliation record, not a new application screen or software approval state.

Record	Details to capture
Identity and scope	Day 1/Day 2 dates; MDA; named submitter, Viewer and Admin contact; FY2026 Q3; funding/expenditure grants.
Source	Register/file name and version; source owner; actual date coverage; naira units; any existing aggregate coverage.
Funding reconciliation	Starting count/amount; new manual/import/offline count and amount; correction delta; final count/amount; source count/amount; explained difference.
Expenditure reconciliation	The same separate figures for payments, including checked funding allocations. Never net funding against expenditure to hide a discrepancy.
Traceability	Public entry IDs/ranges, source references, committed import batch receipts and any outstanding offline reference/error.
Requests and planning	Reference request label/status; AOP code/year/MDA and source; new-field proposal owner; access issues.
Outstanding work	Specific row/reference or issue; next action; responsible person; agreed due date; status. No passwords or secrets.
Day 1 handover	What was completed, what will continue on Day 2 and who holds the original/working files.
Day 2 outcome	Complete and reconciled, or partial with listed differences; Viewer check; Admin issues; agreed follow-up/publication owner.

Escalation drill: Give the facilitator the page, public ID/reference or batch, MDA, fiscal year/quarter, exact error, time and expected result. Include a screenshot only with appropriate information visible. Account/grant and reference/AOP issues go to Admin; missing voucher/source facts go to the MDA source owner; damaged files go back to their preparer; reproducible software problems go to technical support. Agree actual contact names and a follow-up channel at the start of Day 1.

Facilitator FAQ

- **Why is Funding or Expenditure missing?** Check the relevant MDA grant, not just the role name.

- **Why is Edit missing on some rows?** Check publication state, original author and the relevant ledger grant. Viewing an MDA does not let you edit every entry.

- **Can I add a new AOP myself?** MDA Users prepare the approved source details; Admin uses AOP activities. MDA submitters can link a matching MDA/year activity on expenditure.

- **Does Request a value add a new form field?** No. It adds or resolves a controlled dropdown value. New form fields require a development request.

- **Where is Reply?** Responses use Post comment on the same record; the current list is not threaded.

- **Is a comment an approval?** No. Valid server submissions are already reportable.

- **Why is my saved offline row absent from reports?** It must sync successfully first; then reload the relevant list/report.

- **Why does an empty quarter show MDA reporting gaps?** A gap view can enumerate MDAs that have no returns. That is not evidence of transactions in that quarter.

- **Can I upload Excel on Day 1?** Keep real files for Day 2. The facilitator will verify the live CSV/XLSX draft flow first; if it is not ready, use manual entry and assign file processing for follow-up.

- **Is the importer AI-powered and can it read PDFs?** AI import is scheduled for Day 2 subject to readiness. When available, AI help is optional: **Analyze sheets with AI**, **Suggest mapping with AI** and **Suggest answers with AI** send column names, up to 8 sample rows or unmatched values to OpenAI and return suggestions you confirm. Validation and insertion stay deterministic. PDFs are not accepted yet.

- **Should I use today's date?** Only if that is the actual transaction date. This exercise is Q3 2026, so included receipts/payments must be dated 1 July through 30 September.

- **Can I import split-source payments?** Use the manual expenditure form for those; do not duplicate the voucher into separate imported rows.

- **Can I use the quarterly total as one transaction?** Only transaction evidence belongs in the transaction form. Period summaries must follow the appropriate aggregate data path.

- **Does a selected voucher file mean it was saved?** Not in this version. Attachment persistence needs implementation and verification.

- **Can we sign in for the first time offline?** No. Complete sign-in and load permissions/reference data online first.

Live Q3 offline entry runbook

Updated 14 October 2026. Onboarding uses the live database and real Q3 2026 records, dated **1 July to 30 September 2026 inclusive**. The offline segment captures one genuine, previously unrecorded transaction under its responsible MDA submitter. It remains a live submission when synchronized. Use its actual reference and amount; do not create a dummy entry for this demonstration.

This is Activity 9 of the two-day handbook. Reserve the genuine source transaction on Day 1 and recheck it is still outstanding before the Day 2 demonstration.

The supported target is a user who has signed in online and keeps an already loaded app open while connectivity is lost. Offline first-time sign-in and reliable cold restart have not been established. CSV/XLSX Imports requires connectivity throughout upload, review and confirmation; it does not use the manual-entry offline queue.

Prepare before Day 1

1. Confirm the approved live application URL and database project with the Admin. Prefer the deployed production app over HTTPS. All saved records affect live reports; opening localhost does not change this when it uses the live Supabase configuration.

2. Validate each named submitter's MDA and ledger grants, plus separate Viewer/Admin accounts. Use distinct browser profiles rather than tabs sharing login storage.

3. Verify Q3 2026 publication state. If Q3 is locked, resolve the reporting workflow with the Admin; do not demonstrate using Q4 or alter the actual date. Identify one genuine outstanding Q3 receipt or payment, check that it is not already recorded or queued, and remove it from any file about to be imported.

4. Agree the source reference, transaction date, amount and classification with the MDA owner. Record starting Q3 counts/totals and the expected contribution of this one record. Use a production build: `npm run dev` disables the service worker. If the facilitator must host locally, use:

```
npm run build
```

```
npm run start -- --port 3000
```

5. Open the approved live URL (or `http://localhost:3000` for the configured local host). Sign in online and load the selected Funding or Expenditure form and its list. Wait until dropdowns and the account's MDA scope load. Set the actual Q3 date; the form may initially show today's October date.

6. In browser developer tools, check Application / Service Workers for `/sw.js` and an active worker controlling the page. Reload once while still online if needed. Optional installation uses the browser's Install/Add to Home Screen option; installation alone is not proof of offline readiness.

7. Keep the MDA browser profile signed in and the form loaded. Review any existing pending/failed entries before proceeding. Do not clear storage to obtain an empty demonstration screen.

8. Check disconnect/reconnect behaviour before the session without submitting dummy records. Keep this handbook available locally. If a full rehearsal saves the selected real transaction, mark it completed and choose a different genuine outstanding record for the session; never submit it twice.

Day 2 - Eight-minute demonstration

Step	Action	Expected result and narration
1. Establish online state	Show the responsible MDA account, selected real source record, Q3 transaction date and loaded form.	"This is a real outstanding Q3 transaction. It will enter live reporting after it synchronizes."
2. Disconnect	Set browser DevTools Network to Offline, or disable Wi-Fi. Keep the page open.	Offline banner appears. Ensure DevTools affects the app tab being demonstrated.
3. Capture the real record	Enter its actual receipt/payment date, amount, reference and verified classifications. For expenditure, verify the actual funding allocations equal the total. Submit once.	Local capture and Waiting to sync should show the record as Pending. Wait for the outcome rather than resubmitting.
4. Explain storage	Point to the pending item and amount.	"Saved on this device. It has not reached the server and is not yet in server reports."
5. Check the pending item	Compare its reference, actual Q3 date and amount with the source.	Keep the account/tab open. One real record is sufficient; a second demonstration needs a different genuine outstanding transaction.
6. Reconnect	Restore DevTools to No throttling/Online or restore Wi-Fi. Keep the app open.	Automatic sync attempts on reconnect/queue changes; a 30-second retry timer covers transient failures.
7. Verify server save	Wait for the sync result. Refresh online and search the exact reference.	Confirm exactly one server record, correct amount, actual transaction date, MDA and FY2026 Q3. An empty outbox alone is not the full verification.
8. Cross-role check	In a separate Viewer profile, find the reference and compare it with the source.	Record its public entry ID and reconcile its contribution to the Q3 register. Leave comments only for genuine questions.

Expected change is the verified amount of the selected source record in its own ledger. Concurrent participants may also change dashboard totals, so reconcile using the exact reference/public ID and the session's submission log. Expenditure funding allocations classify its sources; they are not a link to a particular funding transaction. Keep the genuine saved record after onboarding.

What to avoid during the live demonstration

- Do not log out, switch users, close the browser or clear site data with pending entries. The current outbox is device/browser storage and is not scoped to the active account in its display/drain code.

- Do not promise a fresh offline start. Profiles and MDA memberships are fetched online and lack a durable offline recovery path; a reload may remove access even when references are cached.

- Do not rely on unsaved form text surviving a refresh. The durable offline path begins when submission is successfully queued.

- The offline queue covers manual entries only. Voucher uploads, AI, comments, requests, account management, BIR publication and Admin corrections require connectivity.

- Do not open an uncached edit page after disconnecting. New-entry reference fallback is explicit; loading an existing entry still depends on fetching that entry. A previously loaded routine edit may queue, but Admin corrections/amendments require connectivity.

- Do not publish Q3 merely to demonstrate the button. A quarter published before a queued change syncs will cause a permanent failure. Complete reconciliation and the authorized publication process separately.

- Do not call cached reports current. Cached list filters may not reflect the selected live filter, and not every screen is cached.

Troubleshooting

Symptom	Likely cause	Facilitator action
Page fails to open offline	Development build, inactive service worker, page not cached or lost permission/profile state	Restore connection, sign in, prewarm the exact page and repeat with the tab kept open.
MDA list empty	Missing grant or permission data lost after offline reload	Reconnect; verify role/grants as Admin; reload account online.
Pending persists	Connection/DNS/server still unavailable	Restore connectivity, keep the page open and allow the retry cycle. Check the exact error.
Failed after reconnect	Duplicate reference, permission change, invalid data or quarter publication	Record reference/error and inspect the server for an existing save before recreating anything. Escalate to facilitator/Admin.
Duplicate error after a timeout	Server may have saved but the response was lost	Search the exact reference online. Do not change references simply to force a second insert.
Entry is locked	BIR quarter published before save/sync	Use the Admin amendment process if appropriate; do not alter the true transaction date to bypass the lock.
Selected attachment missing	File persistence is not wired to the submission route	Explain the limitation; retain the original supporting document outside this demo.

The queue engine has retry/discard helpers, but the displayed Waiting to sync card has no repair/discard controls. Do not direct participants to a nonexistent button. Failed items require a controlled support workflow; preserve the record and error before any cleanup.

Live session sign-off

Record live URL/project, browser/version, responsible account/MDA, source register, actual transaction date, session date/time, Q3 publication state, reference, public entry ID, amount, pending count and any failure message. Mark each independently:

- Online login and correct MDA grants verified.

- Production service worker active.

- Selected genuine Q3 transaction verified as outstanding before entry.

- Offline capture observed for the selected ledger.

- Reconnection produced exactly one server record per reference.

- Viewer saw the synced records.

- Pending/failed records resolved or assigned for follow-up before switching accounts; no storage cleanup discards live data.

- Saved real records retained and included once in the MDA's Q3 reconciliation.

Record the current live Q3 state and actual demonstration result during onboarding; earlier software checks do not establish what happened in this session.

Record the live Q3 submission

Live URL / database project: _____

Responsible submitter / MDA: _____

Source register / file version: _____

Actual Q3 transaction date / reference: _____

Public entry ID / import batch: _____

Amount / ledger / source reconciliation: _____

Viewer check / pending queue / follow-up owner:
_____
